Sprint 1 Coursework Review

Sprint 1 was focused on laying the foundations for our project, and the team worked together effectively to complete all the required setup tasks. From the beginning, everyone contributed to establishing a clear structure for the project and ensuring that the development environment was consistent across all members.

As a team, each took responsibility for different parts of the setup. This included creating the GitHub repository, organising the Kanban board, adding the initial scaffolding files, and configuring the Docker-based development environment. Their combined effort meant that the project was well-structured, easy to navigate, and ready for development in later sprints.

The team also collaborated on the documentation required for Sprint 1, such as refining the project description, outlining the technologies used, and preparing the Code of Conduct. The meeting records and backlog items were clearly documented, showing that the team communicated well and made decisions collectively.

Overall, Sprint 1 was successful because the team worked cohesively, shared responsibilities fairly, and supported each other in completing the setup tasks. The strong foundation built during this sprint has prepared us well for the more detailed requirements and development work in Sprint 2 and beyond.
